Ralls Introduction to Materials Science and Engineering is intended for students who want to learn about the nature of solid substances and, especially, for beginning engineering students who are making their first serious contact with the structure and properties of real solids. It represents, clearly and logically, the chemical and physical principles on which the properties of materials depend.

A material is defined as a substance (most often a solid, but other condensed phases can be included) that is intended to be used for certain applications. Materials can generally be divided into two classes: crystalline and non-crystalline. The traditional examples of materials are metals, semiconductors, ceramics and polymers.

Metallic biomaterials are a central class of materials for use in medical devices. This is primarily due to the high strength and other mechanical properties associated with these materials. This chapter provides an introduction to the basic science of metals focused specifically on alloys used as biomaterials.
