In AWWA M11 the load is calculated as the prism of earth above the pipe. This is the maximum dead load the pipe should see over time. Because steel pipe is designed for maximum possible soil load directly over the outside of the diameter of the pipe when the prism load  $W$  is used,  $D I$  is 1.0. The prism load is a conservative design approach, as the actual earth load on a flexible pipe lies somewhere between the Marston/Spangler trench load and the more conservative prism

If non-self-restrained joints exist in the length of pipe affected by the forces of the resultant thrust, then joints can pull apart. Mechanical couplings are the most prominent example of this condition on steel pipe. Bolted harnesses have been included for many years in AWWA M11 starting with the 1<sup>st</sup> edition in 1964. The first harnesses were simple U-shaped lugs (See Figure 1) with bolts designed to resist the thrust.
