Solutions to Practice Problems V_{th} : (original figure) $1k \cdot I_0 + 2V_x = 3V$ $V_x = 40I_0 \cdot 50$
solve the above: $V_x = V_{th} = 1.2V$ $I_0 = 0.6$ mA We short the voltage source and add an additional voltage source between a and b. (lower figure) R_{th} : So, we have: $1000 \cdot I_0 = -2V_x$
 $V_x = 3V$ solve the above: $I_0 = -6$ mA $-40I_0 - V_x / 50 = I_{ab} = 0.18A$ direction: a to b $R_{th} = 3V / I$

Answer; Known: $V = 24 \text{ V}$ $R_1 = 3 \quad R_2 = 5 \quad R_3 = 4$ (a) Total resistance: $R_T = R_1 + R_2 + R_3 = 3 + 5 + 4 = 12$ (b) the total current $i = V/R_T = 24 \text{ V}/12 = 2 \text{ A}$ (c) the current through each resistor, You know that the total current is 2 A. In a series circuit, $i_1 = i_2 = i_3$, so the current through each resistor is 2 A. (d) the voltage across each resistor.

Solution : Peak input voltage = 20 V. Forward resistance, $r_f = 10 \Omega$. Load resistance, $R_L = 500 \Omega$. Potential barrier voltage, $V_0 = 0.7 \text{ V}$. The diode will conduct during the positive half-cycles of a.c. input voltage only. The equivalent circuit is shown in Fig.1 (ii) Fig. 1. (i) The peak current through the diode will occur at the instant when the input voltage reaches positive peak i.e. $V_{in} = V_F = 20 \text{ V}$.

Transform a combination circuit into a strictly series circuit by replacing (in your mind) the parallel section with a single resistor having a resistance value equal to the equivalent resistance of the parallel section. Use the Ohm's law equation ($V = I \cdot R$) often and appropriately. Most answers will be determined using this equation.
