Comparative research essentially compares two groups in an attempt to draw a conclusion about them. Researchers attempt to identify and analyze similarities and differences between groups, and these studies are most often cross-national, comparing two separate people groups.

Typically, causal-comparative research design can be considered as an alternative to experimental design due to its feasibility, cost-affordability and easy to perform the research. However, in causal-comparative design, the independent variables cannot be manipulated, unlike experimental research.

The goal of comparative research is drawing a solution out of the similarities and differences between the focused variables. Through non-experimental or qualitative research, you can include this type of research method in your comparative research design. 10+ Comparative Research Examples

In section 2.3 we shall enter into the important topic of the comparative approach, i.e. the comparative method and its implications for a 'proper' research design. The central argument will be that a coherent framework of theoretical references and a corresponding logic of inquiry are required.

The Comparative approach: theory and method

Comparative research can inform projects at early stages, providing fodder and direction for initial design concepts, and in the midst of design iterations when refining content, interaction, and general architectural patterns. Some things to consider: Comparative analyses can save time.

Descriptive Research Designs: Types, Examples & Methods

Comparative research is a research methodology in the social sciences that aims to make comparisons across different countries or cultures. A major problem in comparative research is that the data sets in different countries may define categories differently (for example by using different definitions of poverty) or may not use the same categories.

Comparative research - Wikipedia

A causal-comparative design is a research design that seeks to find relationships between independent and dependent variables after an action or event has already occurred. The researcher's goal is to determine whether the independent variable affected the outcome, or dependent variable, by comparing two or more groups of individuals.

Correlational research design: Correlational research is a non-experimental research design technique that helps researchers establish a relationship between two closely connected variables. This type of research requires two different groups.

Research Design: Definition, Characteristics and Types ...

Comparative research is a method of analyzing and comparing different populations and how they differ from each other. As an observational method, a comparative analysis examines the variables in a given period to gain substantial results. This has uses in many fields, such as medicine, business, and social sciences.

Holtz Bacha and Kaid note that in comparative communication research the “ study designs and methods are often compromised by the inability to develop consistent methodologies and data gathering techniques across countries ” (pp. 397 – 398). Consequently, they call for “ harmonization of the research object and the research method ” across studies to guarantee the best possible comparability and generalizability.

Many treatments are adopted into clinical practice without a solid evidence base and might be used heterogeneously across settings. Rigorous randomised controlled trials are therefore needed to inform decisions about the comparative effectiveness of treatments in common use. The mainstay of comparative effectiveness research is pragmatic trial design, which emphasises broad eligibility ...

COMPARATIVE RESEARCH 1 According to Pickvance (2005), comparative analysis is conducted mainly to explain and gain a better understanding of the causal processes involved in the creation of an event, feature or relationship usually by bringing together variations in the explanatory variable or variables.
