Earth Science Stellar Evolution Study Guide

Using the Hubble Space Telescope, an international team of astronomers has been able to study stellar evolution in real time. Over a period of 30 years dramatic increases in the temperature of the star SAO 244567 have been observed. Now the star is cooling again, having been reborn into an earlier phase of stellar evolution.

Description: In this activity, students use multiwavelength images of stars in different stages of evolution to investigate how the initial masses of the protostars determines their evolutionary paths. Images include stellar nurseries, protostars, supernova remnants, planetary nebulae, white dwarfs, neutron stars, pulsars and black holes.

The overall result of stellar evolution is that stars become giants that then turn into white dwarfs, or intrinsically more massive stars become supergiants that then create neutron stars or black holes. Over the course of this evolution, stars feed huge quantities of enriched matter back into the star-generating clouds of interstellar space.
