The ESP8266 ESP-01 is a Wi-Fi module that allows microcontrollers access to a Wi-Fi network. This module is a self-contained SOC (System On a Chip) that doesn't necessarily need a microcontroller to manipulate inputs and outputs as you would normally do with an Arduino, for example, because the ESP-01 acts as a small computer.

How to Connect ESP8266 to WiFi | A Beginner's Guide

Serial Bridge Using ESP8266 One of the most well-known (appeared on Hackaday's blog) and well-designed projects to make ESP8266 as a WiFi-UART bridge is jeelabs's esp-link.

Actually, this project is far beyond being a simple serial bridge as it also manages MQTT client pub/sub and REST HTTP requests in order to connect the MCU to the internet.

The ESP8266 is perhaps the most versatile serial module to connect "things" at the Internet, that why it is so popular in the world of IoT. It is a complete module, which includes a microprocessor which can be programmed directly via the Arduino IDE (C++), or in other environments to build (usually using a high level language itself, the "LUA").

With earlier ESP-xx modules, these two items (the USB-to-serial adapter and the regulator) had to be purchased separately and be wired into the ESP-xx circuit. Modern ESP8266 boards like the NodeMCU are easier to work with and offer more GPIO pins. Most of the boards listed here are based on the ESP-12E

Por defecto, en el ESP-01 viene instalado la versión con la que podemos comunicar con el ESP8266 mediante comandos AT a través del puerto serie. No voy a entrar muy en detalle qué son estos comandos, lo único es decir que fue creado por la compañía Hayes y se convirtió en un estándar para la configuración y parametrización de modems.

The ESP8266 is a low cost Serial-to-WiFi module that interfaces nicely to any microcontroller. However, a word of caution -- it is highly undocumented (primary reason for writing this document), and more importantly, it is frequently updated and not backward compatible.
