We have built an IPv6/IPv4 network address and protocol translator as a device driver running in the Windows NT operating system [15]. Our test environment consists of the translator as a gateway between IPv6 and IPv4 hosts connected to separate Ethernet segments, and it incurs little performance overhead.

6rd is a mechanism to facilitate rapid deployment of the IPv6 service across IPv4 infrastructures of Internet service providers (). It uses stateless address mappings between IPv4 and IPv6 addresses, and transmits IPv6 packets across automatic tunnels that follow the same optimized routes between customer nodes as IPv4 packets.. It was used for an early large deployment of an IPv6 service with ...

IPv6 is the successor to IPv4, which is the current Internet protocol version. In February of 2011 the IPv4 address pool at IANA was exhausted, and in April of the same year the IPv4 address pool at APNIC was also exhausted, so we have to migrate to IPv6 as soon as possible.

In dual stack router, A router's interface is attached with IPv4 and IPv6 addresses configured is used in order to transition from IPv4 to IPv6. In this above diagram, A given server with both IPv4 and IPv6 address configured can communicate with all hosts of IPv4 and IPv6 via dual stack router (DSR).

When Cisco IT first embarked on its journey to IPv6, most IPv6 service providers provided IPv6-over-IPv4 tunnels. As services providers begun offering dual-stack services, Cisco IT worked with its existing service providers to plan the transition.

These added security features depend entirely on proper design and implementation of IPv6, and the more complex, flexible infrastructure of IPv6 makes this process more difficult. Nevertheless, if properly configured, IPv6 networking will be significantly more secure than IPv4 by a longshot. 2. Scalability

With the exhaustion of the IPv4 addressing space quickly approaching, it has become a high priority for organizations to begin their own deployments of IPv6. This can be accomplished in a number of different ways. The common methods include side-by-side implementations of IPv4 and IPv6, the implementation of tunneling over existing IPv4 networks, and the implementation of a translation process from IPv4 to IPv6.
