CCP MODULE: CCP stands for Capture, Compare and PWM. These are built in module in pic microcontroller. It is a special module in pic microcontroller designed for modulation and waveform generation applications. It is also used to generate specific time delay. This module OF pic microcontroller contains a 16-bit register which can operate as:

### ~~CCP module Capture Compare Pulse Width Modulation~~

The PIC16F887 microcontroller has two such modules - CCP1 and CCP2. Both of them are identical in normal mode, with the exception of the Enhanced PWM features available on CCP1 only. This is why this chapter describes the CCP1 module in detail. Concerning CCP2, only the features distinguishing it from CCP1 will be covered.

Introducing The CCP Module This is a multi-purpose module that we can switch between 3 different modes of operation. At each mode of operation, this module can perform a specific task that could be useful for many applications. The Microchip PIC16F877A Chip that we're using has a couple of identical CCP modules CCP1 & CCP2.

### ~~CCP Modules (Capture/Compare/PWM) - DeepBlue~~

Capture-Compare-Pulse-Width-Module (CCP) is a special module designs for modulation and waveform generation applications. This module basically works on three different modes (capture/compare and PWM odes). The PIC 16F877 chip contains two CCP ports (CCP1 and CCP2). Each of this CCP module contains 16 bit registers which works as

### ~~PIC16F877 CCP Modules Capture Compare PWM Modes~~

14.1 Introduction Each CCP (Capture/Compare/PWM) module contains a 16-bit register which can operate as a 16-bit capture register, as a 16-bit compare register or as a 10-bit PWM master/slave Duty Cycle register. The CCP modules are identical in operation, with the exception of the operation of the special event trigger.

### ~~Section 14. Compare/Capture/PWM (CCP)~~

The PIC Microcontroller has an inbuilt CCP module and PWM can be easily generated using the inbuilt CCP module. CCP stands for Capture/Compare/PWM. CCP modules are available with a number of PIC Microcontrollers. Most of them have more than one CCP module. Here, I am referring to PIC16F877A that has 2 CCP modules, named CCP1 and CCP2. Each Capture/Compare/PWM (CCP) module contains a 16-bit register which can operate as a: 16-bit Capture Register. 16-bit Compare Register.
