Exponent is the number of times a number is multiplied by itself. Exponents are written as  $x^y$ ; where  $x$  is the number and  $y$  is the exponent or power. Example:  $2 * 2 * 2 * 2 * 2 = 2^5$  The  $n$ th root of a number  $x$  is a number  $r$  which, when raised to the power of  $n$ , equals  $x$ . i.e  $r^n = x$  In the above example  $2^5 = 32$ , hence 2 is the 5th root of 32. Exponents []. Exponents, or powers, are a way of indicating that a quantity is to be multiplied by itself some number of times. In the expression  $2^5$ , 2 is called the base and 5 is called the exponent, or power.  $2^5$  is shorthand for "multiply five twos together":  $2^5 = 2 \times 2 \times 2 \times 2 \times 2 = 32$ . Notice that the exponent tells us how many bases to multiply, not how many multiplications to perform.
