Silicon nitride is a chemical compound of the elements silicon and nitrogen. Si<sub>3</sub>N<sub>4</sub> is the most thermodynamically stable of the silicon nitrides. Hence, Si<sub>3</sub>N<sub>4</sub> is the most commercially important of the silicon nitrides when referring to the term "silicon nitride". It is a white, high-melting-point solid that is relatively chemically inert, being attacked by dilute HF and hot H<sub>2</sub>SO<sub>4</sub>. It is very hard. It has a high thermal stability.

Silicon nitride - Wikipedia

Silicon nitride (Si<sub>3</sub>N<sub>4</sub>) is a non-oxide structural ceramic material that is usually black or dark grey in colour, and often polished to give a smooth and strikingly reflective surface appearance.

Silicon Nitride: Properties, Production, and Applications ...

Silicon nitride (Si<sub>3</sub>N<sub>4</sub>) is a light, hard, and strong engineering ceramic that has been developed mainly as a structural material for high-temperature applications. Although creep resistance and superplasticity are incompatible functions, superplastic forming of silicon nitride can be applied to make wear-resistant components that are used at intermediate temperatures.

About Silicon Nitride Silicon Nitride has the most versatile combination of mechanical, thermal, and electrical properties of any technical ceramic material. It is a high performance technical ceramic that is extremely hard and has exceptional thermal shock and impact resistance.

## Silicon Nitride - Precision Ceramics

Silicon Nitride is the winner when it comes to its ability to take the heat and abrasion dished out by extreme saltwater conditions and long screaming runs against tight drags. Use originally as a ball bearing material in jet engines, SiN can handle just about anything including wire line. SiN rings are slightly heavier and larger in diameter than other rings to maintain the rugged specifications that make them the perfect choice for heavy duty boat or offshore rods.

Silicon oxynitride is a ceramic material with the chemical formula  $\text{SiO}_x \text{N}_y$ . While in amorphous forms its composition can continuously vary between  $\text{SiO}_2$  (silica) and  $\text{Si}_3\text{N}_4$  (silicon nitride), the only known intermediate crystalline phase is  $\text{Si}_2\text{N}_2\text{O}$ . [2] It is found in nature as the rare mineral sinoite in some meteorites and can be synthesized in the laboratory.
