A single phase induction motor adjustable speed drive control is implemented with hardware setup and software program in C code. The main feature used in DSP and microcontroller is their peripherals to realize pulse width modulation. One chip and re-programmable ROM replaces the conventional complicated circuit solution.

The construction of the rotor of the single-phase induction motor is similar to the squirrel cage three-phase induction motor. The rotor is cylindrical and has slots all over its periphery. The slots are not made parallel to each other but are a little bit skewed as the

shaded-pole single-phase, and polyphase. In two-pole single-phase motors, the torque goes to zero at 100% slip (zero speed), so these require alterations to the stator such as shaded-poles to provide starting torque. A single phase induction motor requires separate starting circuitry to provide a rotating field to ...

Single-Phase Induction Motors. The single-phase motor operates under the same principle as the polyphase motor, except that the rotating magnetic field effect generated by the stator does not exist until running rpm is reached. Since no starting torque is available, a design mechanism is included to start the motor.
