~~CORE~~

In the RF signal chain,

the power amplifier (PA) is the active element located between the transmitter signal chain circuitry and the antenna, Figure 1. It is often a single discrete component, one with requirements and parameters which differ from those of much of the transmit chain as well as the receiver circuitry.

power amplifier classes in which amplifier normally operates. In order to operate a transistor for a certain class, the gate and drain dc voltages have to be biased carefully to the certain operating point (quiescent point or q-point) 1. Class A- q point is about 0.5, it is biased at close to half of its saturated current.
